KISMEATI PETREL

Plates 35 and 36

GADYI PETREL

Pterodroma neglecta

The Gadfly Petrel is a medium-sized bird, with a length of about 30 cm. It has a black cap, a white throat, and a red bill. The underparts are white, and the upperparts are brown. The wings are black with white tips. The Gadfly Petrel is a solitary bird, and it is often seen flying over the sea. It is a good flyer and can soar for long periods. The Gadfly Petrel is found in the Southern Ocean, and it is a rare bird that is difficult to see. The Gadfly Petrel is a long-lived bird, and it can live for over 20 years.

SHEARWATERS, FULMARS, PRIONS and PETRELS

Procellariidae

The Procellariidae is a family of seabirds that includes the shearwaters, fulmars, prions, and petrels. The family is divided into two subfamilies: the Procellariinae and the Pelecanoidae. The shearwaters are the most numerous and widespread species, and they are found in all oceans. The fulmars are smaller birds, and they are found in the Northern Hemisphere. The prions are a group of black and white birds, and they are found in the Southern Hemisphere. The petrels are the smallest birds, and they are found in all oceans. The Procellariidae is a family of birds that is well adapted to life on the ocean, and they are able to fly for long periods without stopping.
